Idaho Crop Input Price Summary for 2004

Paul E. Patterson and Robert L. Smathers
University of Idaho

Background

This publication provides price information for operating inputs commonly used to produce crops in Idaho. The information can be used to develop or modify cost of production estimates for traditional or alternative crops or cropping systems. Input prices include: herbicides, fungicides, insecticides/nematicides, fertilizers, seeds, interest rates, labor, fuel, water assessments, custom rate charges for chemical and fertilizer applications and crop insurance rates. Additional custom rates are found in University of Idaho Bulletin 729, *1998/99 Custom Rates for Idaho Agricultural Operations*. A PDF version of this publication is available on the Internet at

<http://info.ag.uidaho.edu/pdf/BUL/BUL0729.pdf>

The University of Idaho College of Agricultural and Life Sciences publishes costs and returns (CAR) estimates -- also referred to as enterprise budgets -- for many of the major crops grown in Idaho. These CAR estimates are revised and published every other fall in odd-numbered years. Livestock CAR estimates are revised and published in even-numbered years. PDF versions of the CAR estimates can be found on the Internet at <http://www.ag.uidaho.edu/aers> Check under **Resources** and then **Crops**.

Idaho crop costs and returns estimates are developed for four regions of the state. Not only are there different crops produced within these regions because of varying climatic and soil conditions, but the crop production practices for the same crop can vary significantly by region. The four crop regions include: 1) Northern Idaho (NI) with primary emphasis on Benewah, Boundary, Clearwater, Kootenai and Latah counties 2) Southwestern Idaho (SWI) with primary emphasis on Canyon and Elmore counties, 3) Southcentral Idaho (SCI) with primary emphasis on Jerome, Twin Falls, Cassia and Minidoka counties, and 4) Eastern Idaho (EI) with an emphasis on two areas: Power, Bingham, and Bannock counties for the southern part of the region and Bonneville, Madison, Fremont and Jefferson counties for the northern portion of the region. The Southcentral region also contains crop costs and returns for the Blaine-Lincoln county area and the Lemhi-Custer-Butte county area.

Procedure

Cost data reported in this publication are the averages by region. The data were collected by phone and mail surveys conducted during the summer and early fall of 2004. Sample selection was not random, nor was the sample stratified according to characteristics of the firms. The objective of the surveys was to obtain representative price information within each geographic region, including price information from different firms operating within a region. Firms with multiple outlets in a given geographic area were sampled only once.

Five primary types of businesses were surveyed. These were 1) irrigation districts and canal companies, 2) custom applicators, 3) agricultural lenders, 4) farm chemical and fertilizer dealers and 5) seed dealers. The price for seed potatoes and the cost of treating potato seed was obtained from a survey of Idaho seed potato growers. The seed potato prices shown in Table 10 are the F.O.B price for whole seed potatoes in the seed producing area, plus the cost of handling and transportation from the seed area to the commercial potato area of the respective regions.

General Input Costs

Input costs that don't vary consistently between regions and those that don't fit one of the major input categories are found on page 8 in Table 1. This is a catchall category and includes interest rates, labor costs and the irrigation power rates for Idaho Power.

Interest Rates

Agricultural lenders use a risk rating system to evaluate a customer's credit status. Along with loan volume, the credit score is used in determining the interest rate on a loan. Low risk, high volume borrowers are charged a lower the interest rate. Interest rates can also vary depending on whether the rate is variable or fixed over the loan period. The interest rate charged on an operating line by most banks is on a "Prime Rate plus basis." Typically, the interest rate is 0.5 to 2.5 percent above the Prime Interest Rate. The rate charged on the operating line can remain variable and fluctuate with the Prime Rate. It can also be fixed for a specified period of time, six months for example. The interest rate on intermediate term loans lasting one to eight years was typically 0.25 to 0.50 percent above the operating interest for a given borrower.

Typical interest rates charged on operating and intermediate term loans are shown in Table 1. Operating loan interest rates at the time of the survey (August) ranged between 5.0 and 7.0 percent. A typical interest rate was 6.0 percent. This rate pertains to a low credit risk customer on a moderate to high loan volume. At the time of the survey in August, 2004 the Prime Rate

was 4.5 percent, 0.5 percentage points higher than August 2003. Since August, the Federal Reserve has raised interest rates twice by .25 percent. Further increases are expected over the next 6 to 12 months. The interest rate charged on intermediate loans, money borrowed from one to seven years, varied from 5.25 to 7.5 percent in the August survey. A typical rate was 6.5 percent. This rate assumes a fixed rather than a variable rate loan, and a low credit risk borrower. Cheaper financing is available through many machinery dealerships.

Labor

Labor charges used in the CAR estimates vary according to the type of job and the skill of the laborer. There are three labor categories used in the University of Idaho CAR estimates. These are shown in Table 1. "Other labor" pertains to unskilled, seasonal labor hired primarily to help during planting and harvesting. Irrigation labor is the hourly wage equivalent paid to move handlines and wheelines, or to manage center pivots. Machinery labor includes semi-skilled labors that operate tractors, machinery and drive trucks. The labor costs shown in Table 1 are based on a 2001 survey of potato farmers in southern Idaho, adjusted to 2004 using the USDA's Wage Rate 1990-92 Prices Paid Index. From July 2001 to July 2004, the Wage Rate Index changed from 153 to 159, or 4 percent. The base wage rates from the 2001 survey were increased by 4 percent. The labor costs include a base wage, plus the employer's payroll tax contribution and other benefits and overhead typically paid by the employer. The value of benefits varies by the class of labor and is expressed as a percent of the base wage. The benefit rate is 15 percent for other labor, 25 percent for irrigation labor and 30 percent for machinery labor. The benefit percentages also come from the 2001 and earlier labor surveys.

Power Costs

The cost per acre of inch of water applied using a center pivot irrigation system with a corner system for a 160 acre field, a 69 percent pumping plant efficiency and zero feet of lift (pressurization only) was \$1.26, based on Idaho Power's Agricultural Irrigation Schedule 24 for 2004. This is the standard used in most irrigated crop costs and returns estimates published by the University of Idaho. The Idaho Power Schedule 24 changed from 2003 in that the Idaho Public Utilities Commission approved part of the rate adjustment sought by Idaho Power. A portion of the annually adjusted Power Cost Adjustment was moved to the base energy charge. While the energy charge per kilowatt-hour increased from 2003 to 2004 (2.8416 cents vs 3.2618 cents), the effective rate (the base rate plus the power cost adjustment) declined from 4.1575 cents per kWh to 3.7672 cents per kWh, a 9.4% drop.

General Input Costs With Regional Variation

Table 2 on page 8 includes fuel prices, water assessments and fertilizer component prices by region. The fertilizer component prices found in Table 2 are derived from fertilizer product prices listed in Table 9. Fertilizer in the University of Idaho CAR estimates is listed in pounds of element, not product. The price per pound for nitrogen (dry and liquid), phosphate (dry and liquid), potassium and sulfur are included in Table 2. The source material is identified in the last footnote below the table.

Fuel

Fuel price varies by location within the state. The price of gasoline typically increases by 3-5 cents from Southeastern Idaho to Southcentral Idaho and increases by another 3-5 cents from Southcentral to Southwestern Idaho. Diesel prices do not always follow a consistent price difference by region. But in general, diesel prices are cheapest in southeastern Idaho and increase going west. The price for fuel in northern Idaho was obtained two months later than the prices in southern Idaho, so they are not directly comparable. Fuel prices had fallen by approximately 5-10 cents between these two time periods. Overall, the price for fuel was quite volatile during 2004. Diesel prices are \$.25 to \$.40 higher than in 2003. Gasoline prices are up by \$.35 to \$.40 per gallon over prices in the 2003 survey. The price for gasoline shown in Table 2 is for bulk delivery un-leaded with the road-use tax included. The price for diesel is for bulk delivery and does not include the road-use tax.

Irrigation Water Assessments

A typical water assessment charge for each region is shown in Table 2. These water assessment charges are the simple average of the values reported by irrigation districts and canal companies contacted in each region. The same irrigation districts/canal companies are surveyed each year to maintain consistent base for price change comparisons. Assessments made on a per share of water basis are converted to a per acre charge. All canal companies and irrigation districts surveyed deliver water to the farm in an open ditch.

Water assessments reported by the seven water organizations surveyed in Southwestern Idaho averaged \$33.60 per acre, ranging from a low of \$22.00 per acre to a high of \$45.00. The average water assessment charge reported by the four water organizations surveyed in Southcentral Idaho was \$27.20, ranging from \$19.00 to \$38.00 per acre. Water charges in Eastern Idaho are considerably lower than for the other two areas of southern Idaho, averaging \$13.05 per acre and ranging from \$8.50 to \$25.00 per acre. Four water organizations were surveyed in Eastern Idaho, three in the north end of the region and one in the south end of the

region. The average per acre cost for the north and the south regions was \$9.10 and \$25, respectively.

Fertilizer Component Prices

The component fertilizer prices, shown in Table 2, can be used to revise cost estimates where fertilizer is specified by element, not by total pounds of product. Table 9 contains the price per ton of various source materials as well as the price per pound for micronutrients. The component price will vary depending on the source material. The dry nitrogen price in Table 2 is based on the price of nitrogen in Urea (46-0-0) and is used for most pre-plant nitrogen applications in the University of Idaho's CAR estimates, while the liquid nitrogen price is based on the price on nitrogen in Solution 32 (32-0-0). The liquid nitrogen price is typically used on post-planting applications. Dry phosphate price is based on the price of phosphate in 11-52-0 with the nitrogen in 11-52-0 valued at the price of nitrogen in Urea (46-0-0), while liquid phosphate price is based on the price of phosphate in 10-34-0 with the nitrogen valued at the price of nitrogen in Urea. Potassium price is based on Muriate of potash (0-0-60).

Custom Rates

Table 3 on page 9 contains the rate charged by aerial applicators for both liquid and dry material applications. Table 3 also lists the custom charges made to apply fertilizer and chemical by various ground methods. Aerial application charges typically vary by the quantity and type of material applied. The charge for applying liquid materials falls into the categories based on the application rate. While other categories exist, Table 3 shows the most common categories: 3-gallon, 5-gallon, 7-gallon, 10-gallon and 15-gallon rates. Aerial application of dry material is typically charged on a per pound basis with a minimum per acre charge. The minimum per acre charge on dry material is generally based on 100 pounds of material. Many custom aerial applicators have a sliding scale, charging less for a large acreage and more for smaller jobs. They may also charge less when fields are large and easily accessible, compared with small or irregular shaped fields. These same factors help explain some of the regional cost differences. Fields in Eastern Idaho tend to be large, while those in Western Idaho, and to some extent Southcentral Idaho, are smaller. The standard charge in Eastern Idaho is for large fields, while the standard charge in Western Idaho is for small fields. These regional differences are reflected in Table 3. The rates charged for ground application were obtained primarily from fertilizer and chemical retailers who also sell the product. Table 3 also contains costs of other types of services, including the custom application of apply sulfuric acid to kill potato vines.

Herbicide Prices

Table 4, found on pages 10-12, gives regional price information for herbicides. Dry material is priced per pound and liquid material is priced per gallon or ounce. There are a few products priced per case. The price of liquid products was generally based on a 2-1/2 gallon container price. Prices are rounded to the nearest \$.05. While the list of herbicides is not all encompassing, it covers a wide range of products currently used on row crops, small grains and other crops for which the University of Idaho has developed CAR estimates.

Sticker/Spreader Prices

The price per gallon for commonly used stickers and spreaders are found on page 13 in Table 5. Prices are rounded to the nearest \$.05.

Fungicide Prices

Table 6, found on page 14, contains regional price information for commonly used fungicides. Dry material is priced per pound and liquid material is priced per gallon or per ounce. Prices for the liquid products were based on a 2-1/2 gallon container. Prices were rounded to the nearest \$.05. Fumigants are listed in Table 7 found on page 15.

Insecticide and Nematicide Prices

Insecticide and nematicide prices are shown in Table 8 on pages 15 and 16. Dry material is priced on a per pound basis and the price of liquids is per gallon, based on a 2-1/2 gallon container price. Prices were rounded to the nearest \$.05.

Seed Prices

Table 9 on page 17 contains seed prices by region. Prices are per pound, per hundredweight or per unit as in the case of sugarbeet seed. Seed prices were obtained only for those crops for which the University of Idaho presently publishes a CAR estimate. *Please keep in mind that there is a great deal of variability in seed prices, particularly among different varieties.* The seed prices in Table 9 should be considered representative, but they are by no means comprehensive. Seed prices in Table 9 generally include a seed treatment. Potatoes are an exception.

Fertilizer Prices

Table 10 on page 18 contains the price information on fertilizer. Prices for the macronutrients are per ton or per gallon. The formulation of the various materials is also shown. Prices for micronutrients (trace elements) are given per pound of element. Some caution is advised on the prices for the trace elements. The price variation was extreme and there are likely subtle but important differences in the source material that were not apparent.

Crop Insurance

Crop insurance rates vary considerably even within a narrow geographic area. The insurance rates on page 19 in Table 11 are expressed in the cost per \$100 of insured crop value. These "typical" rates were obtained from crop insurance companies in each region. The insurance is based on hail-fire, not multiple peril. The values in Table 11 should not be used uncritically as insurance rates reflect risk. Higher insurance costs should be used in areas with high loss potential and lower rates for lower risk areas. An example of how to convert these to per acre value follow. Consider a farmer producing irrigated wheat in southcentral Idaho. If the farmer wished to insure \$300 of crop value per acre, the insurance cost per acre would be \$6, given the \$2 rate per \$100 of crop value.

Costs and Returns Estimates

Crop costs and returns estimates can be obtained at county Extension offices, normally for a fee, or they can be downloaded from the Department of Agricultural Economics and Rural Sociology website at the following URL: <http://www.ag.uidaho.edu/aers> Click on Resources, then on Crops. Each budget is a separate publication, which is stored as a PDF (portable document file). A program called Acrobat Reader is required to view and or print these files. A link to obtain a free copy of Acrobat Reader is also shown on the AERS website.

Further Information

For additional information about publications and other resource materials available from the College of Agriculture, contact Ag Publications, University of Idaho, Moscow, ID 83844-2240 (885-7982).

If you have any questions or comments regarding the information contained in this publication, contact Paul Patterson (ppatterson@uidaho.edu) at the Idaho Falls R & E Center, 1776 Science Center Drive, Suite 205, Idaho Falls, ID 83402 (529-8376) or Bob Smathers (rsmather@uidaho.edu) at the Department of Agricultural Economics and Rural Sociology, P.O. Box 442334, University of Idaho, Moscow, ID 83843 (885-6934).

The authors would like to thank all the companies and individuals who assisted with this publication by providing price information. Because of the confidential nature of the information obtained from companies participating in the survey, it is our policy not to identify the companies that provide information. While this keeps us from publicly thanking the cooperators, it also avoids problems of price disclosure. We would also like to thank the Idaho Potato Commission for their assistance in funding a portion of this project under BDK902, Cost of Potato Production in Idaho.

Table 1. General input costs, 2004.

	<u>All Regions</u>
Operating Interest	6.00%
Intermediate Term Interest	6.50%
Machinery Labor*	\$12.15
Irrigation Labor*	\$ 8.15
Other Labor*	\$ 7.20
Pumping Cost per Acre Inch of Water Based on 2004 IPC rate, center pivot, 0 lift	\$1.26
<u>Idaho Power Irrigation Service: Schedule 24</u>	
Monthly Service Charge: irrigation season	\$12.00
Demand Charge per kW: irrigation season	\$ 4.02
Energy Charge Base Rate: per kWh	3.2618¢
Power Cost Adjustment: per kWh	0.5054¢

* Labor includes a base wage plus 15 percent for taxes and benefits on other labor, 25 percent on irrigation labor, and 30 percent on machinery labor.

Table 2. Fuel, water assessments and fertilizer component prices by region, 2004.

	<u>NI*</u>	<u>SWI*</u>	<u>SCI*</u>	<u>EI*</u>
Gasoline per gallon - bulk delivery**	\$2.01	\$2.08	\$2.04	\$2.01
Diesel per gallon - bulk delivery**	\$1.57	\$1.58	\$1.50	\$1.44
Water Assessment/acre		\$33.60	\$27.20	\$13.05
Eastern Idaho: South District				\$25.00
Eastern Idaho: North District				\$9.10
Dry Nitrogen per lb*** (46-0-0-0)	\$.37	\$.32	\$.29	\$.30
Liquid Nitrogen per lb*** (32-0-0-0)	\$.47	\$.35	\$.35	\$.34
