

Jan 30th '80

Dear Don,

I hope that these samples of blades from Livres de beurre of Grand Brezignou reach you all right. May they help you to make further progress in your research. Here some remarks:

- 1.) The diagnosis of livre de beurre flakes can be made from the lateral retouches on the upper side, going to the ridge:

- 2.) From the underside, the usual picture is:

3.) Abrasion  Typical Side view

A question is the meaning of the traces of abrasion on the ridge: It can never be found on the nucleus and it is always present on the blades. I have the feeling, that the abrasion is stronger on the outside:

Now another very pleasant and important point: I have to visit a trade exhibition "the world of concrete" in Las Vegas and have booked my flight via Salt Lake City. The time is between March 1, 2 and 3 that I could make a stop over in Kimberly, but only if you are there and if you have time and if you feel in the mood for some further "shop talk" about flint knapping. I have to be in Las Vegas from 4-7 March and then in New York till 12. March. Needless to say I would be most happy on my side and would very much look forward seeing you again. So tell me abso-

lutely freely. I also have no idea
how the weather is like. Maybe
your garden is covered with 3 ft of
Snow?! In all cases I will put
another livre de beurre for you in the
mail while I am over there. It
would also be fine to meet Gene Vidmus
again.

So, this is all for today. I wish
you good health and all the best
in the meantime. And if you are
away at that time or if we cannot
meet at 1-3 March I wish you the
same anyway!

Best regards Peter
