InDear Dick; togotla ne vd ed ; waw enc sees canado ym warb I

mee and interest are carried in entirely different doldward Received your two letters. Thanks. Time is still as short as ever, and I am even further behind on the things I want to do, such as my correspondence list. Abd I've really GOT to get to work on this new story -- two of them, in fact. I am going to clean up this wild thing I have had laying around so long, and then tear into Sky third Skylark. This wild yarn isn't going to be so bad, either. I've got it peetty well rounded no lo up into shape, and darned if I don't really like it! Of course, it isn't anything like anything else I ever tried -- maybe that's why I like it. The new Skylark, though, is going to be a brutal thing to write. Have been working almost a year on the outline alone. Got it fairly well in hand, I think; but I wish it were done! As you know, a climax to Three -- where I climaxed everything I could -- will have to be something that will knock "em into an outside loop; and I'm not quite convinced yet that I can handle it without letting down. If I can't, I'll scrap it.

Sent for one, got it, read and enjoyed it immessely. He told me he thought it was the best thing he ever wrote -- and I agree with him. For sheer power, I have never seen its equal.

Spacehounds. You said exactly what I thought you would say.
But there was, and is, a reason for most of that stuff. The
Skylark was widely criticised, and with reason, as being pseudoscience, and not scientific fiction. Spacehounds was designed
and written as strictly scientific fiction. The fact that it is
really scientific called for some pretty heavy doses of physics;
and at the same time compelled me to limit the scope of activity
to our own solar system. That limitation in turn robbed me of
an opportunity --- or rather, let me say, made XX impossible such
powerful and imaginative effects as abounded in the Skylarks.

You see, I was, and am, between the devil and the deep blue sea. It is impossible to be wildly imaginative and strictly and prosaically scientific at one and the same time---and yet that is what most of you fellows seem to expect of me. However, in the second and third Spacehounds (I think I have told you that this was the first of a projected series of three; the other two to be interstellar, and intergalactic, respectively, in scope. For these stories it will be necessary to transcend science a bit; but with a really scientific foundation laid in this first yarn, I think I can get away with all the power and emotion of the Skylarks, without offending the pure scientists too badly.

You yourself are making a horrible break when you compare me to Merritt in "gripping power" and "emotion". Merritt is a master, as you already know I think---but he is utterly u scientific; and you should know better than to call any of his work scientific fiction. It is fantastic fiction of a fine and wonderful kind---but he does, and should, emphasize exactly the things he does. I could not write his style, any more than he could write mine---we attain our ends by diametrically opposed means.

I draw my characters one way; he by an altogether different method. Suspense and interest are carried in entirely different ways -- in fact, there is no single point in common by which Merritt and I can simultaneously be criticised. I like his stories immensely, and he has told me that he likes mine; and it is quite probable that the same man could like both of us--os basons but that lets us out int bliw sidt on meals of golog me

So, youngster, you are more nearly right than you thought in your last page - - you cannot stress both pure emotion (aside from love and character-drawing) and science in the same story wit out having something that smells to high heaven thing to write. Have been work as a botched job. it feirly well in hand,

In this connection, I wouldn't be surprised if you would like this thing I am writing now better than either the Skylarks or the Spacehounds, simply because it does go into human emotions, instead of science. It is quite possible that you are not really a lover of purely scientific fiction; but like fantastic fiction, thinly veneered with science, much better than you admit. For that is what the Skylarks actually were: and Merritt's stories, (particularly the Ship) contain not an iota of actual science. The man actual science.

Well, I was due on another job long ago, so I'll have to chop this off. Think I've answered most of the points; and I certainly do thank you again for the real appreciation you have shown of my stories. Toodle-ooo. To yled a grant and the stories of the stories o

science, and not scientific fiction. Spacehouse was designed and written as strictles of notific fiction. The fact that it is really scientific called the same compared me to limit the scope of activity to our own solar system. That limitation in turn robbed me of an opportunity --- or rather, let me say, made IX impossible such powerful and imaginative offects as abounded in the Skylarks.
