

# What Exactly is Hyperspectral Remote Sensing?

Jeremy P. Shive  
Herpetology Laboratory  
Department of Biological Sciences,  
Idaho State University

# Outline

- What is hyperspectral data?
- Hyperspectral Processing “Hourglass”
- My Research

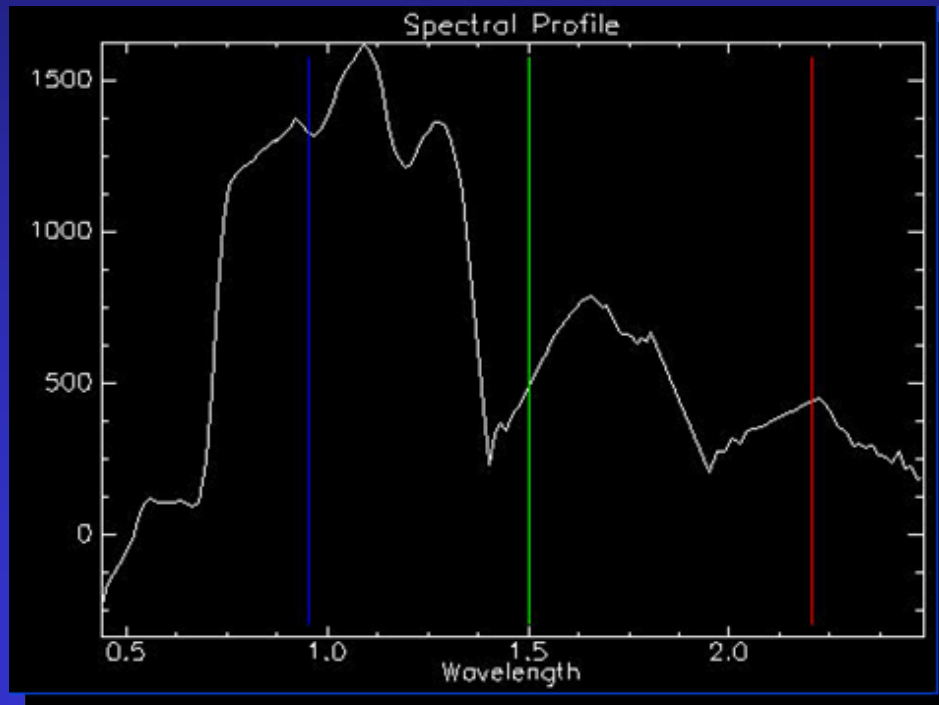

# Imaging Spectrometry

- Definition- The acquisition of images in hundreds of registered, contiguous spectral bands such that for each element it is possible to derive a complete reflectance spectrum (Goetz et al.1985)

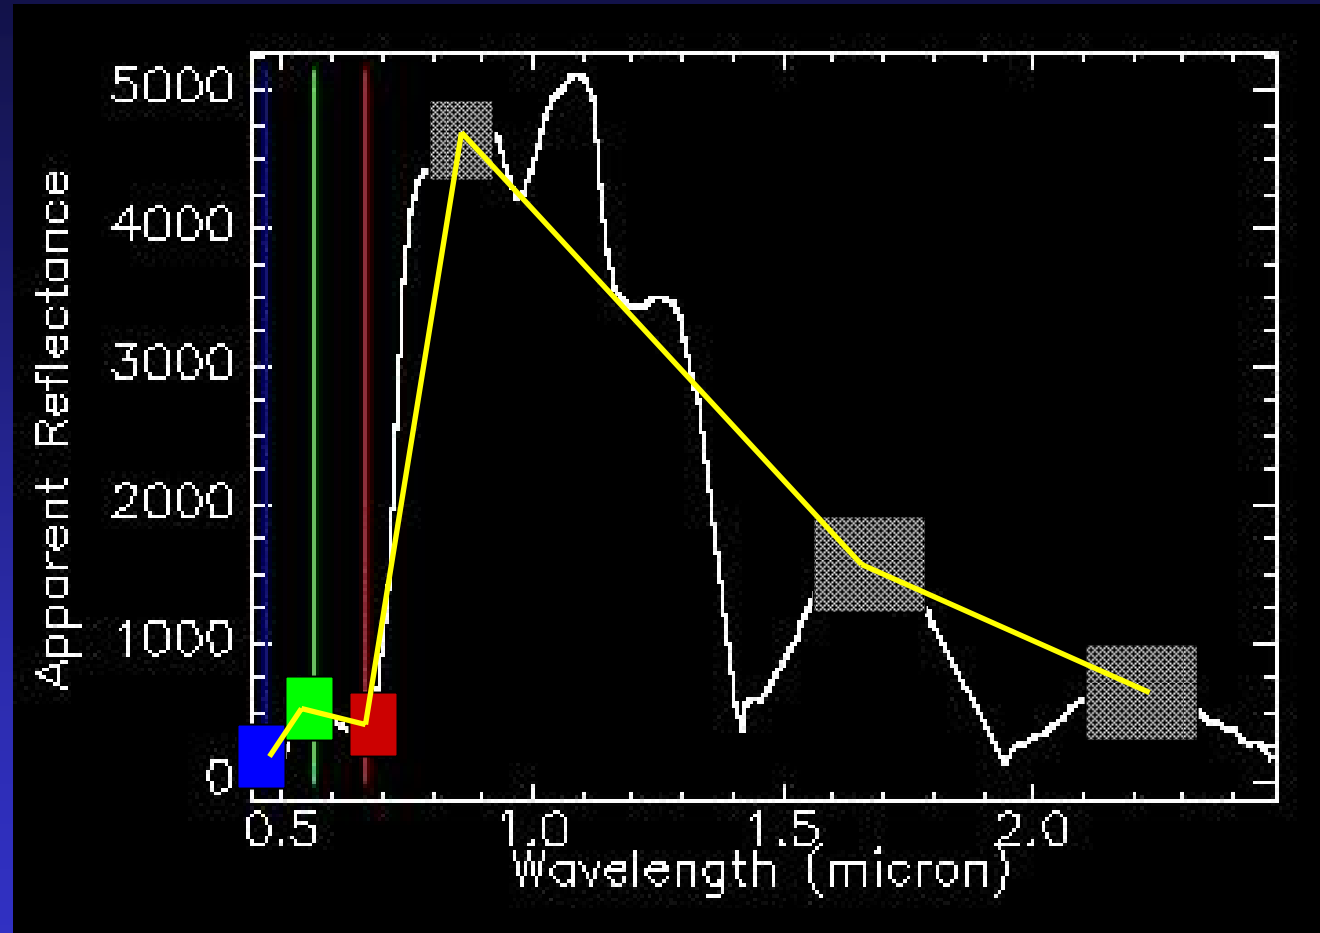

# Hyperspectral Data

- Multiple images taken simultaneously at successive wavelengths for a single spatial location

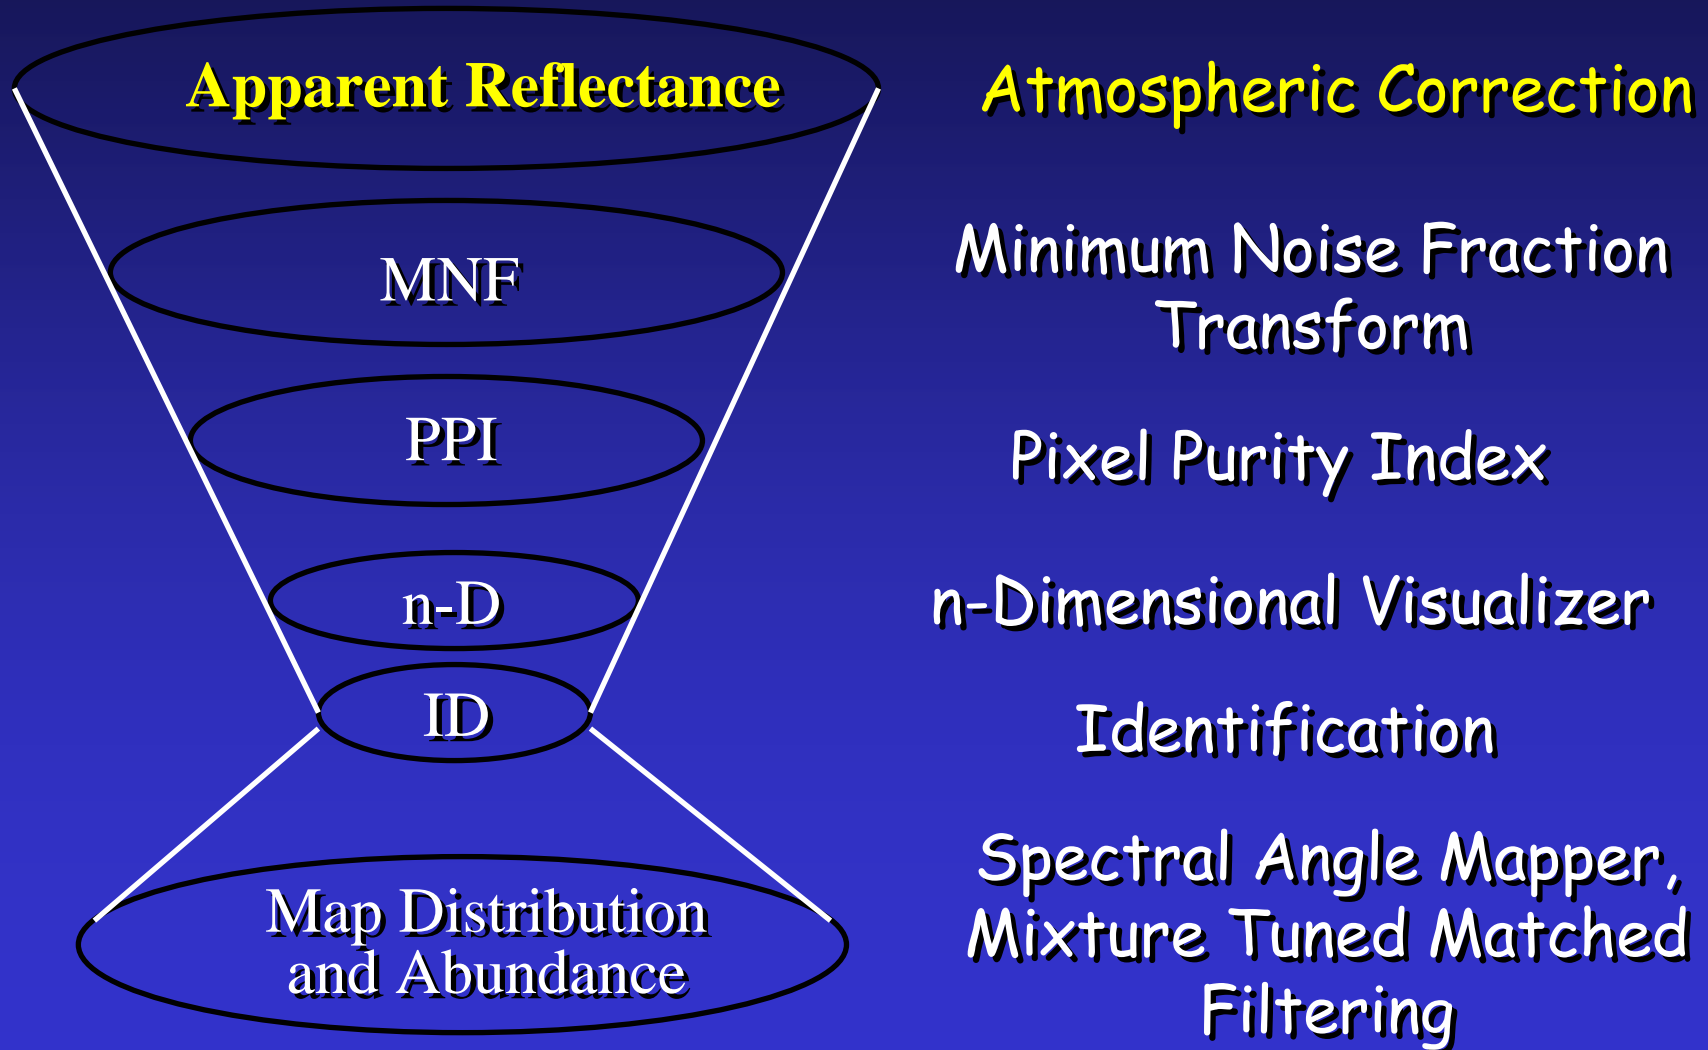

# AVIRIS, TM Spectral Measurements

# Hyperspectral Processing

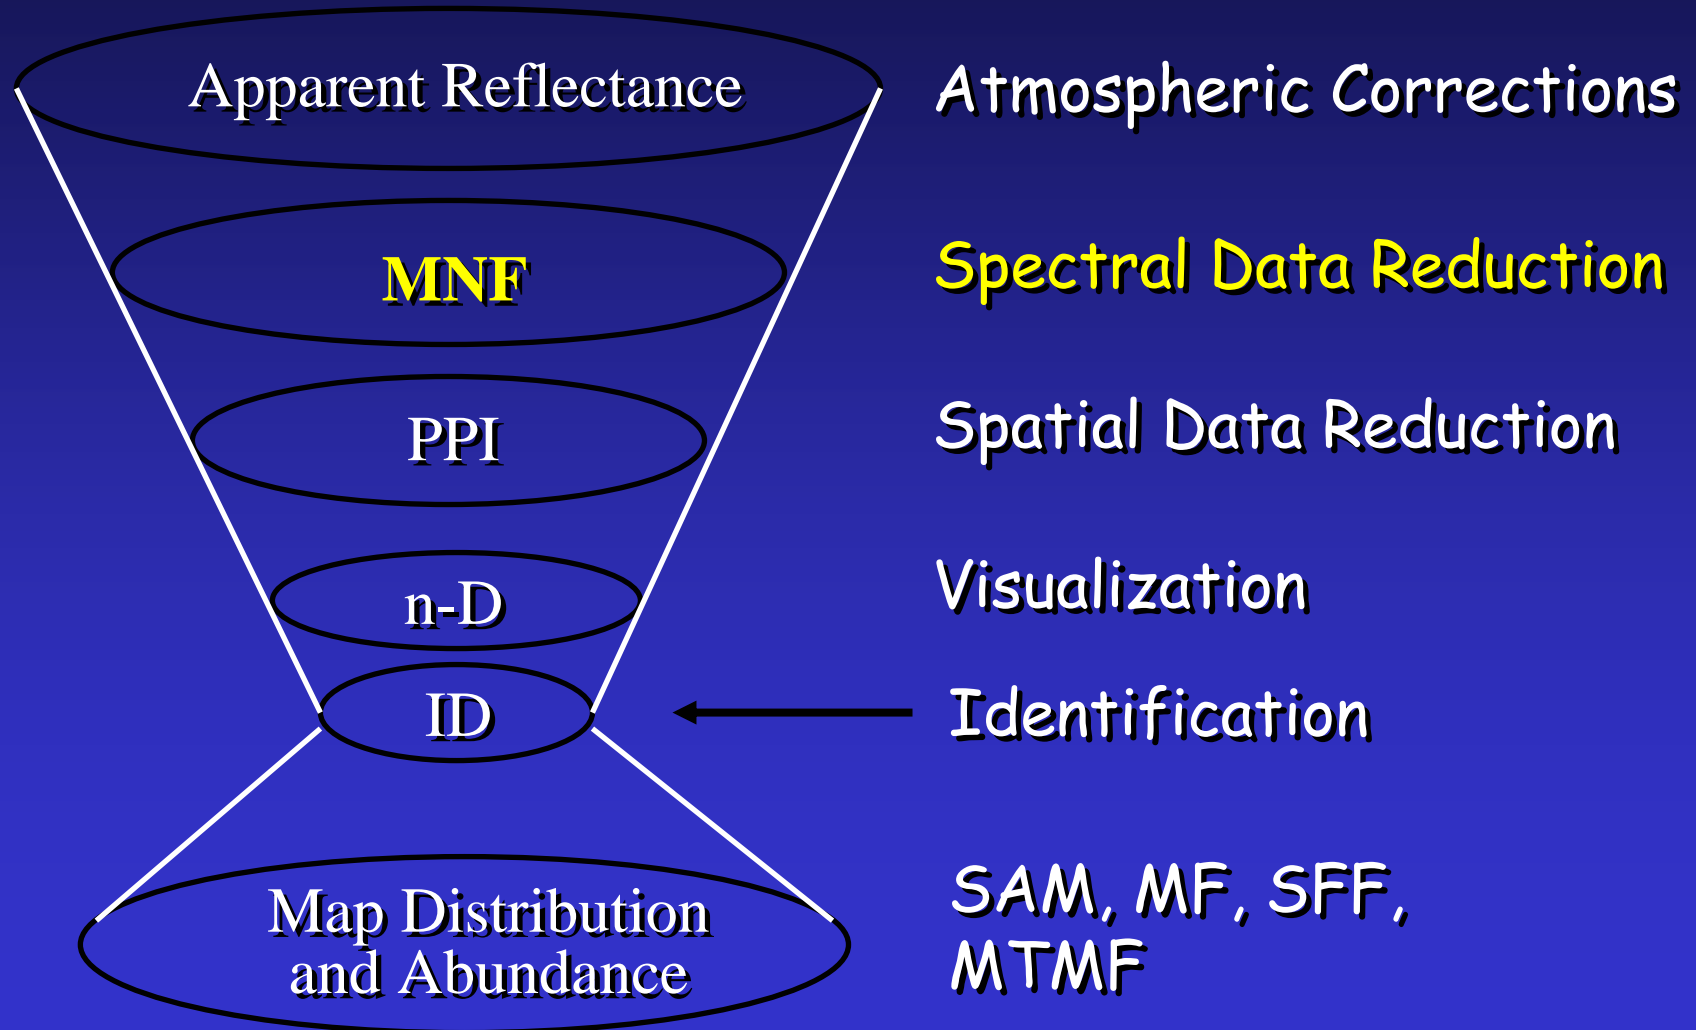

# Apparent Reflectance

- Incorporates solar irradiance curve
- Removes atmospheric scattering and absorption effects

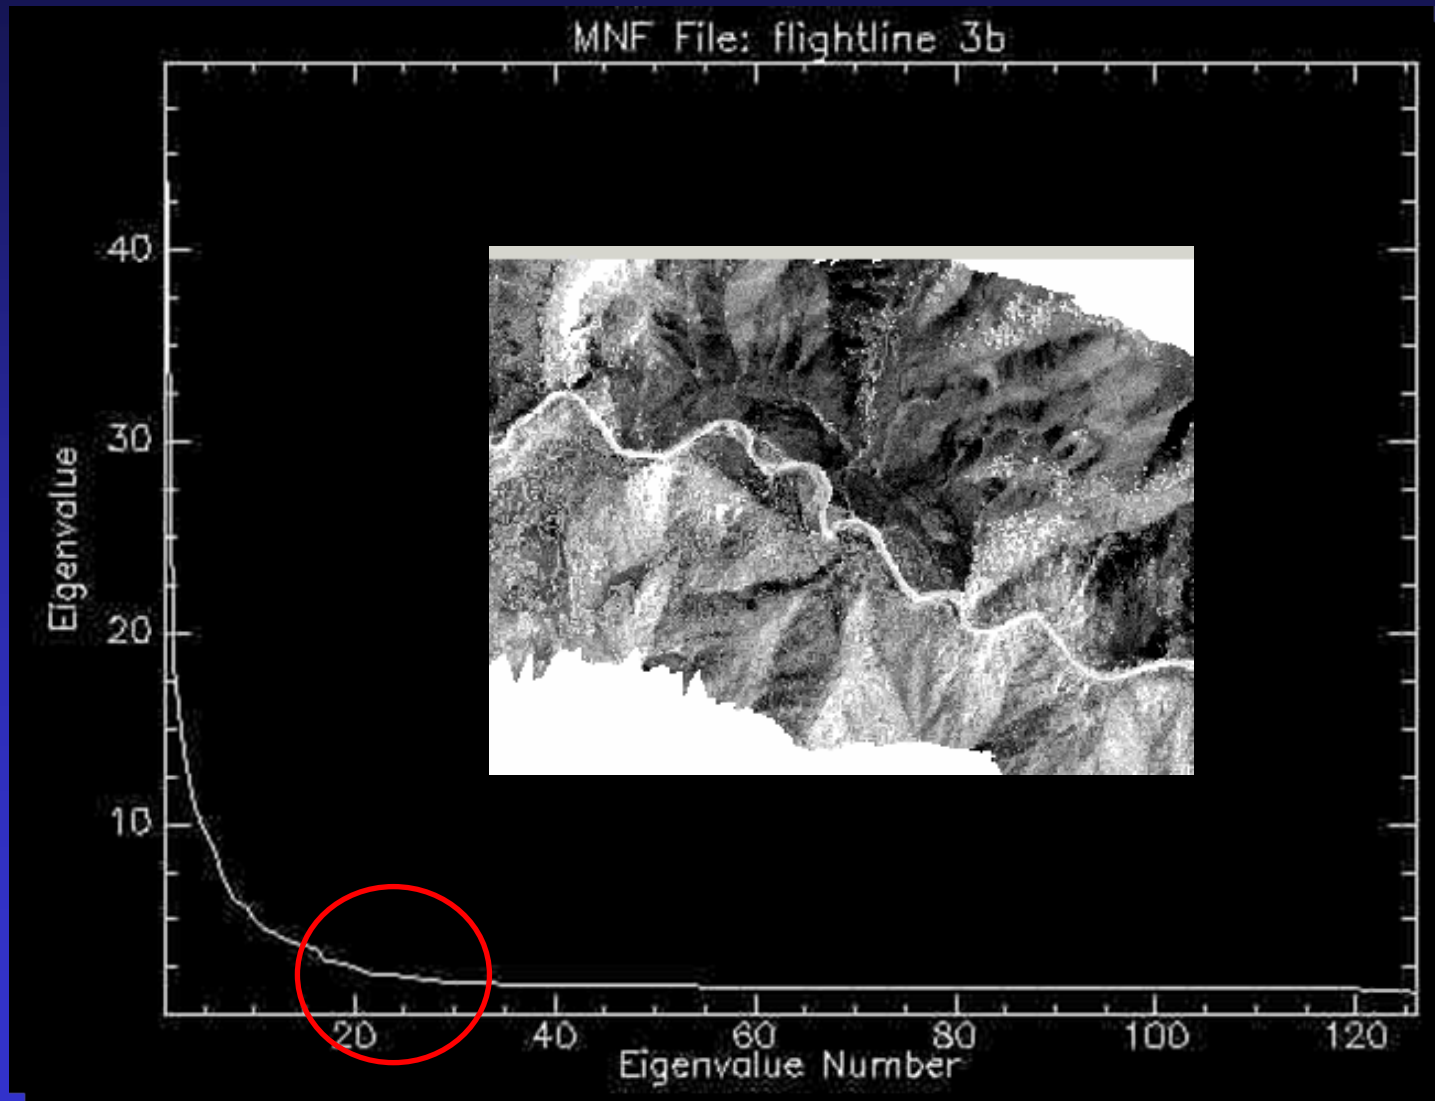

# Hyperspectral Processing

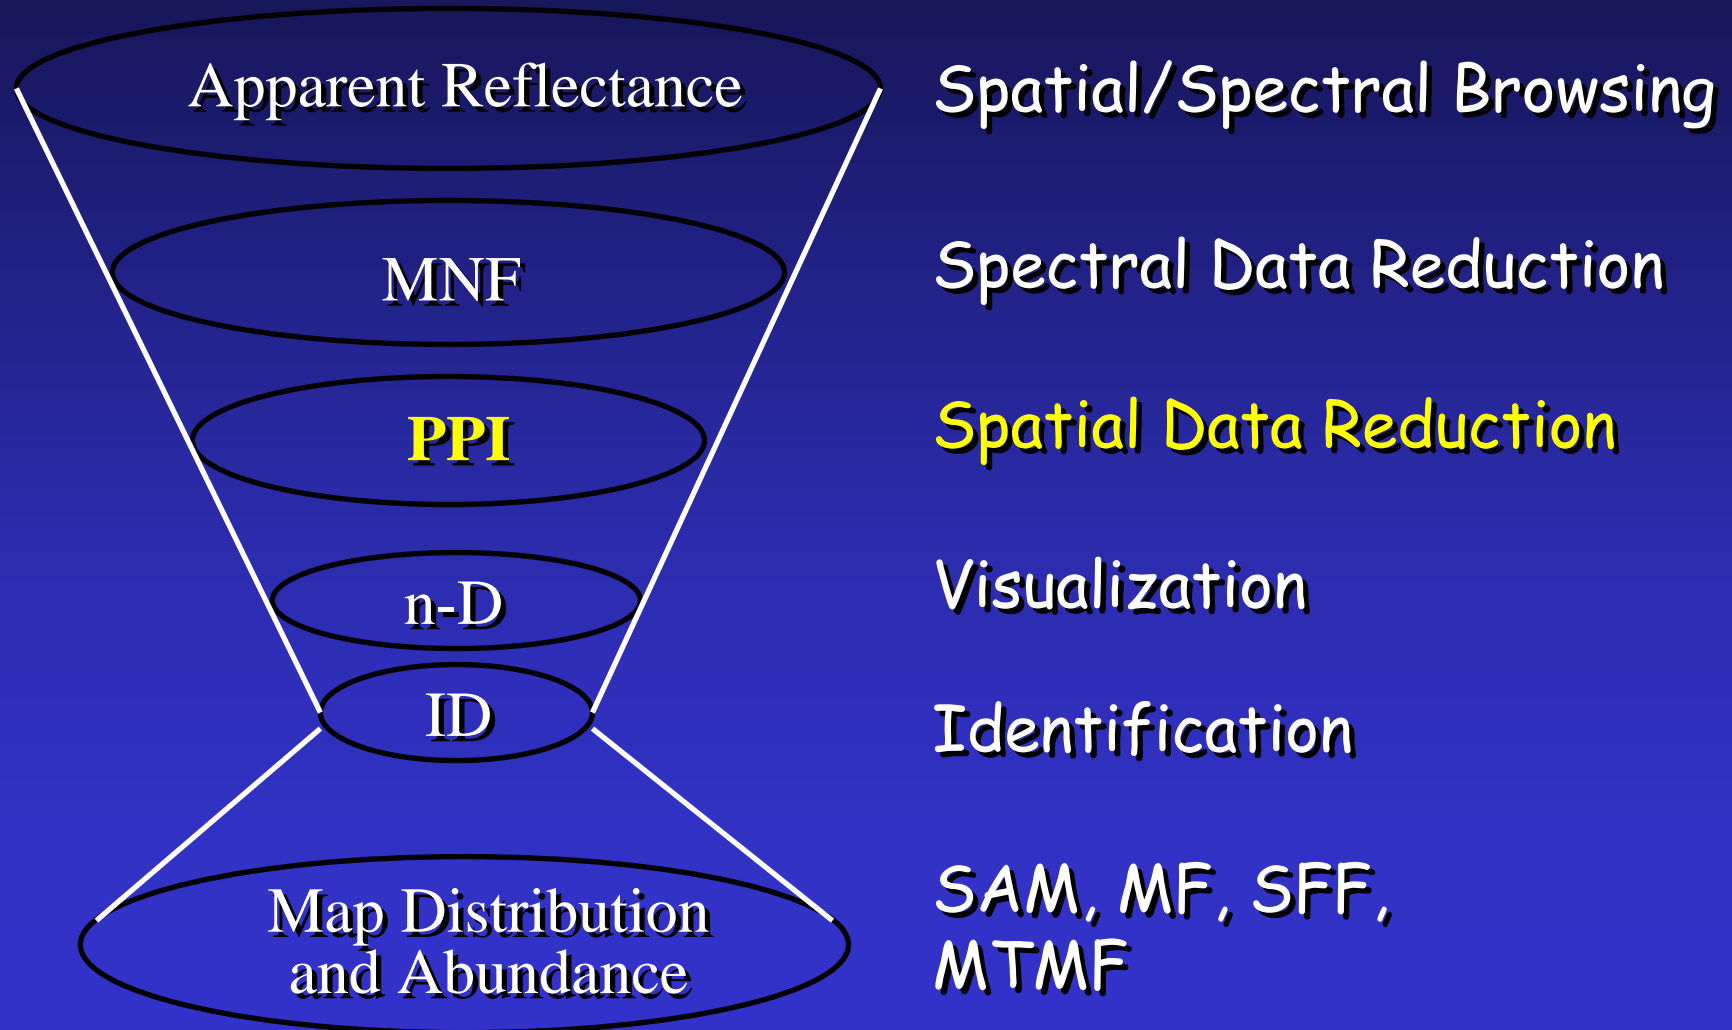

# Minimum Noise Fraction (MNF) Transform

- **Noise-Whitened Principal Components**
- Step 1: Based on an estimated noise covariance matrix, decorrelates and rescales the noise in the data
- Step 2: Standard Principal Components transformation

# Data Dimensionality

# Hyperspectral Processing

# Pixel Purity Index (PPI)

- Identifies the most “spectrally pure” or extreme pixels (endmembers)
- Repeatedly projecting n-dimensional scatterplots onto a random unit vector (convex geometry)

# Hyperspectral Processing

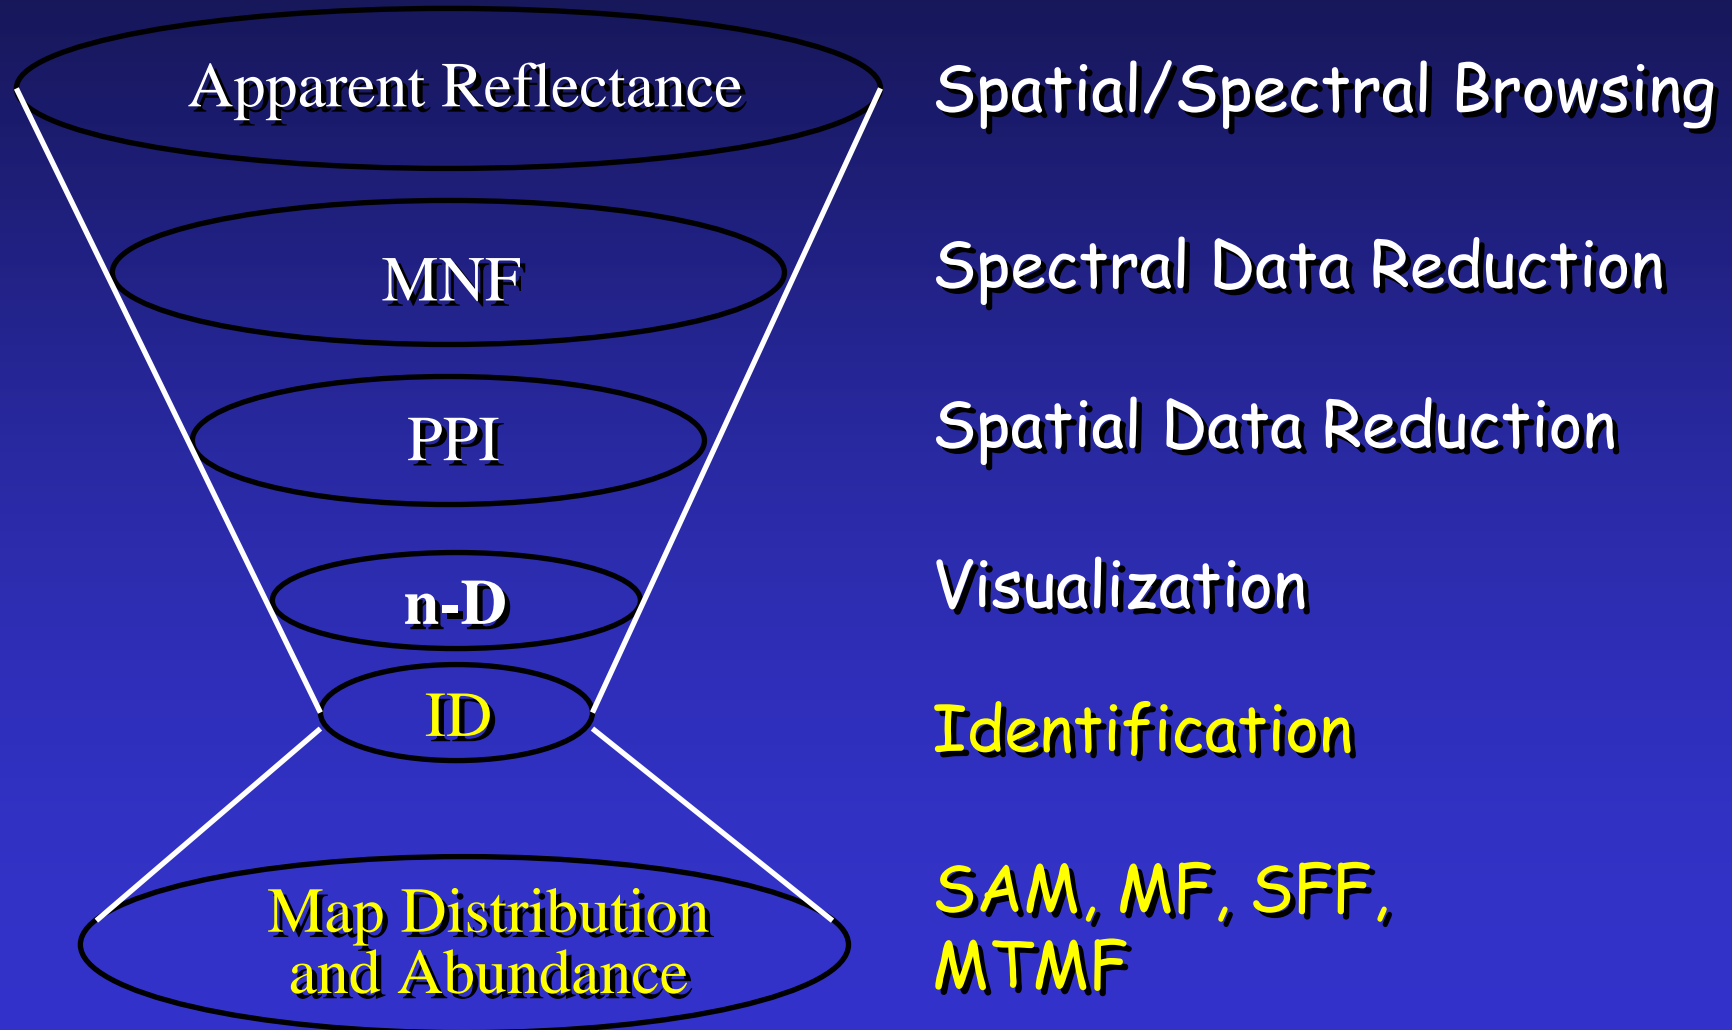

# n-Dimensional Visualizer

- Interactive tool to locate and cluster “purest pixels” using an n-dimensional scatterplot

# Hyperspectral Processing

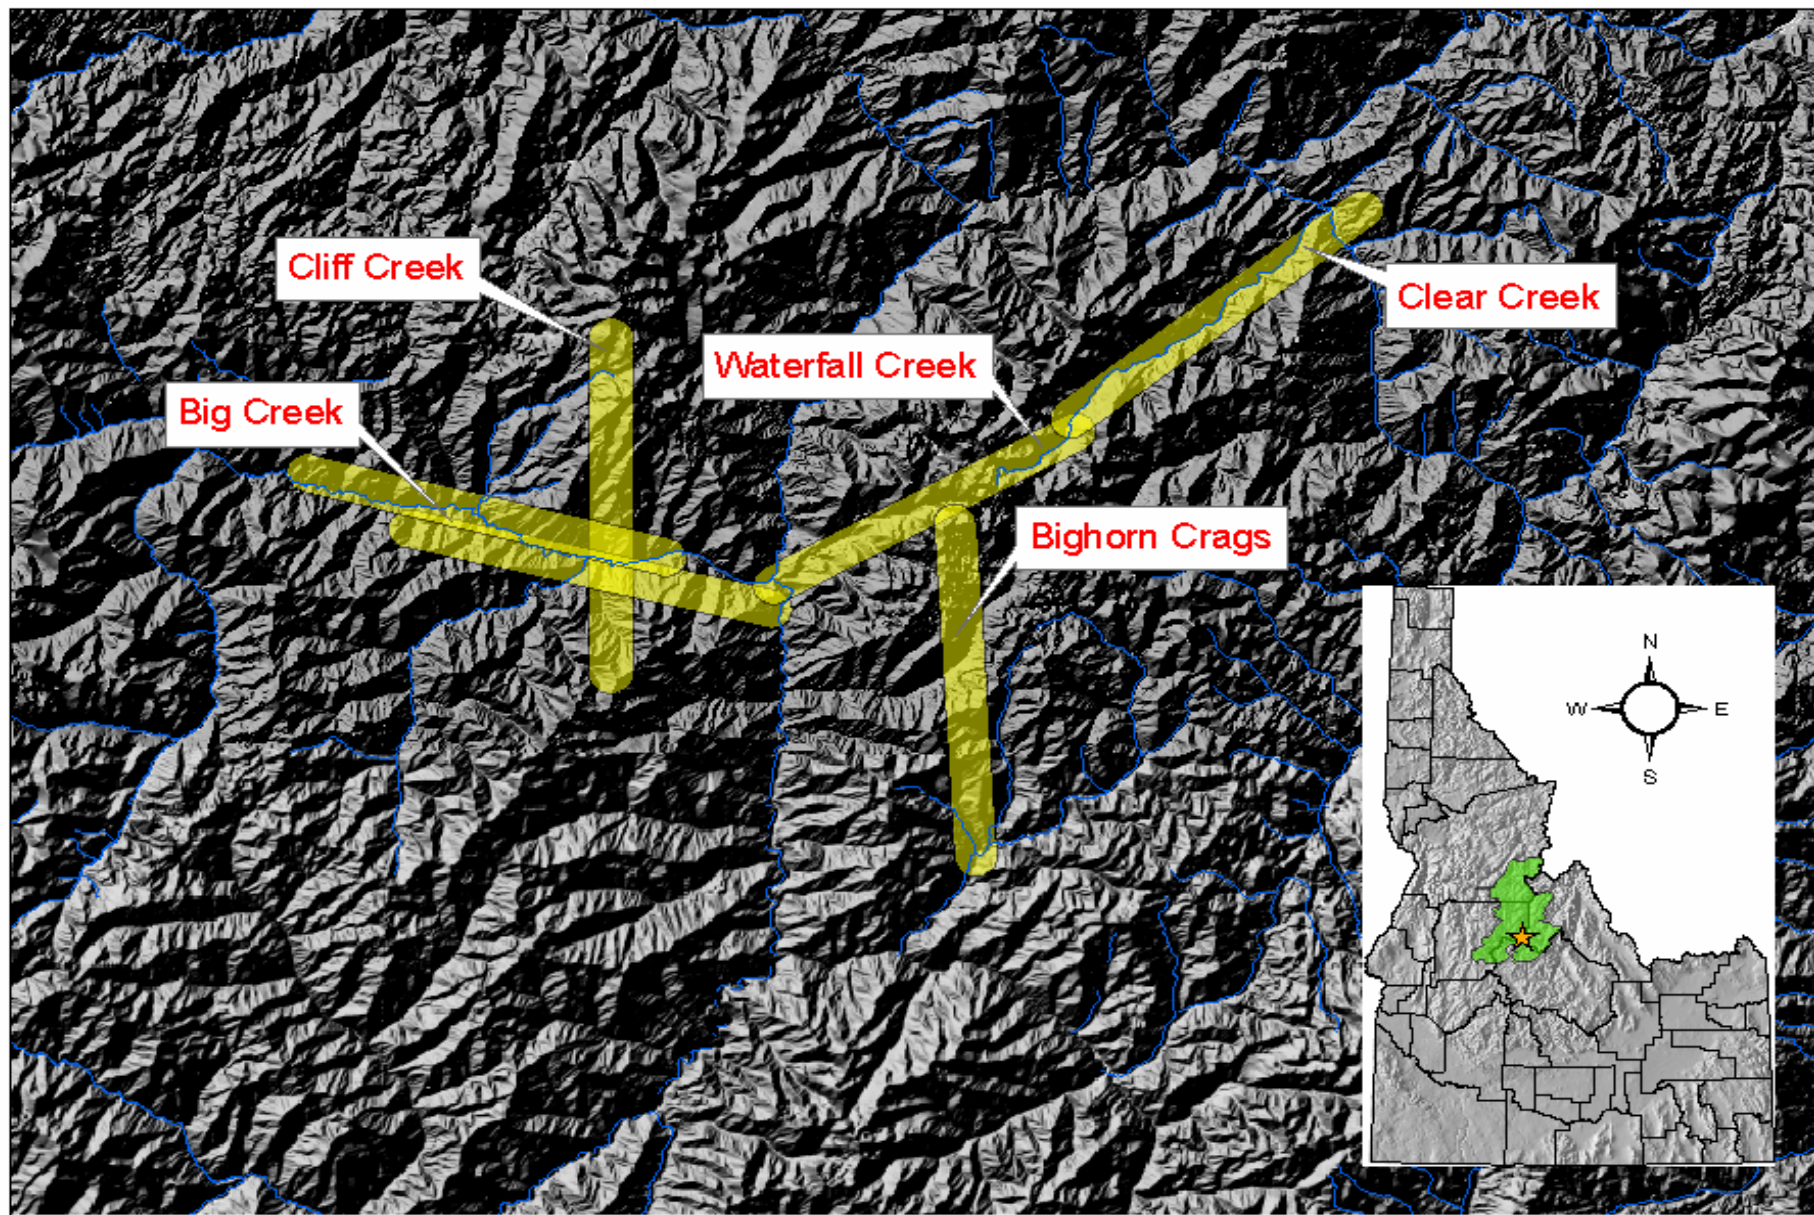

# Hyperspectral Applications

- **Oceanography**: constituents, sediments, bathymetry
- **Geology**: mineralogy and rock & soil identification
- **Ecology**: vegetation species (community) identification, forest health, vegetation water content
- **Snow and Ice Hydrology**: grain size and runoff/snow pack
- **Agricultural**: crop type, yield, stress

# My Research

- Need to assess current population status
- Knowledge of wetland distributions is a fundamental first step
- Incorporate into future management plans

0 5 10 20 30 40 Kilometers

0 2.5 5 10 15 20 Miles

# My Research

- Multiscale Assessment (Spectral/Spatial)
- ADAR Multispectral, HyMap Hyperspectral, Landsat 7 ETM<sup>+</sup>
- Evaluate Cost of Imagery, Time of Processing, Accuracy Assessment

# Big Creek Area

- Amphibian presence is associated with backwater channels and pools and emergent vegetation

# Mapping Shallow Water Sediment

- Identified a submerged sediment endmember and mapped distribution

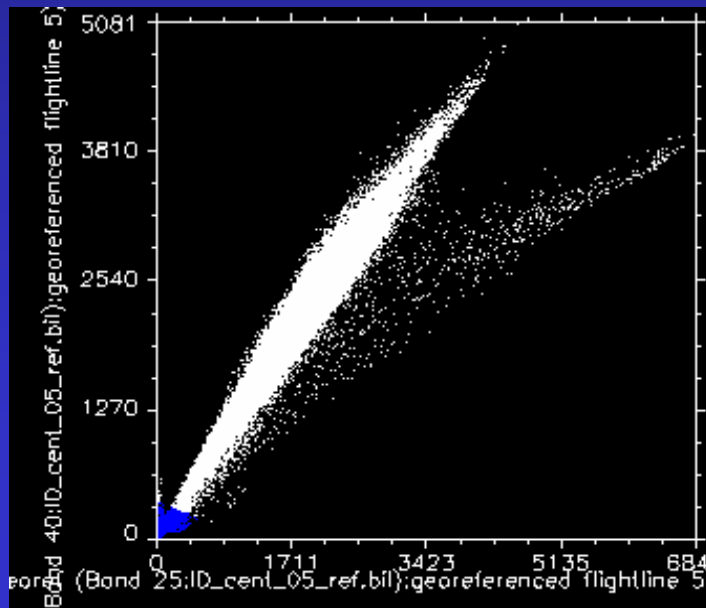

# Mapping Moist Vegetation

- Identified regions where vegetation shows larger absorption of leaf water

# Bighorn Crags Area

- Amphibian presence is associated with emergent sedges
- 2-D scatterplot using NIR bands to identify standing water

# Lake Depth and Composition

- Mask Water Features
- Classify three depth categories and substrate

# Summary

- Preliminary results suggest that hyperspectral data can successfully map amphibian habitat
- Hyperspectral data may distinguish breeding, foraging, and overwintering habitat (in some landscapes)
- Potentially important method for wetland habitat mapping and conservation
