# Blueberries <br> 1991 production costs in northern Idaho ${ }^{6} 1993$ 

L. D. Makus, D. L. Barney, B. B. Davis, C. L. Codr, and A. E. Levi NIVERSITY OF $10 A 40$

This budget shows typical costs of producing blueberries in northern Idaho for sale in the fresh market. Assumptions used in constructing this budget are discussed below. This study models typical cultural practices based on interviews with growers and Extension personnel familiar with blueberry production. However, individual operations will differ depending on management style and horticultural practices. Since commercial blueberry production is limited in Idaho, budgets from other areas are also used for information.

## The blueberry stand

This study assumes that a typical blueberry stand in northern Idaho is 2 acres. Years 0 and 1 are the establishment years. Land preparation occurs in year 0 , followed by planting in year 1 . Years 2 and 3 are maintenance years that have no blueberry production. Partial production occurs in years 4,5 , and 6 . Years 7
through 20 are full production years. Table 1 provides a summary of expected blueberry yields and costs on a per-acre basis during the life of the stand.

## Machinery and equipment

Table 2 provides detailed information for all machinery and equipment used in the operation. The estimated machinery costs were generated using standard coefficients from the American Society of Agricultural Engineers. The values assumed on all machinery and equipment reflect 1991 prices for new equipment.

## Resources

It is assumed that land is owned by the blueberry grower and was previously used for dryland grazing with a value of $\$ 200$ per acre. Property taxes are $\$ 6.25$ per acre.

Table 1. Yield and cost summary for blueberry production over the 20 -year expected life of the stand.

| Year | Stage of production | Yield (Ib/acre) | Cost/acre (\$) | Cost/pound (\$) |
| :--- | :--- | :---: | :---: | :---: |
| 0 | Preparation | 0 | $1,327.45$ |  |
| 1 | Establishment $^{\text {Maintenance }}{ }^{1}$ | 0 | $4,612.29$ |  |
| 2 | Maintenance $^{1}$ | 0 | $2,103.21$ |  |
| 3 | Partial production $^{2}$ | 0 | $1,904.80$ |  |
| 4 | Partial production $^{2}$ | 500 | $4,884.86$ |  |
| 5 | Partial production |  |  |  |
| 6 | Full production | 2,000 | $5,711.71$ | 2.77 |
| 7 to 20 | 5,000 | $7,365.42$ | 2.86 |  |

${ }^{1}$ The lower cost per acre in year 3 as compared to year 2 is caused by not seeding the fescue cover crop, saving $\$ 123.26$; reduced machinery costs of $\$ 64.90$; reduced overhead of $\$ 6.36$; and reduced interest costs of $\$ 10.91$. Mowing two more times increases costs by $\$ 7.02$.
${ }^{2}$ The differences between costs in partial production year 4 and full production years 7 to 20 are caused by reduced harvest costs of $\$ 2,750$; reduced overhead costs of $\$ 142.37$; and reduced interest costs of $\$ 134.61$. The differences between costs in partial production year 5 and full production years 7 to 20 are caused by reduced harvest costs of $\$ 2,000$; reduced overhead costs of $\$ 103.00$; and reduced interest costs of $\$ 97.13$. The differences between costs in partial production year 6 and full production years 7 to 20 are caused by reduced harvest costs of $\$ 500$; reduced overhead costs of $\$ 24.25$; and reduced interest costs of $\$ 22.17$.

Table 3 includes information on the permanent structures needed for the blueberry operation. Costs assume the structures are purchased new. Purchase price and useful life may vary depending on type of materials used and age of the facility.

This 2-acre blueberry stand is equipped with a drip irrigation system. The cost of the system (excluding labor) is approximately $\$ 5,000$. Table 4 includes detailed information about the irrigation system. The system is supplied by surface water.
All labor in this operation is classified as either general hired, owner labor, or harvest labor. General hired labor is valued at $\$ 6.25$ per hour and includes worker's compensation, unemployment insurance, and other labor overhead expenses. Owner labor is valued at $\$ 7.00$ per hour, and harvest labor is hired at $\$ 0.50$ per pound of harvested blueberries.

## Establishment costs

The cost of establishing the blueberry stand must be recovered over the stand's useful life. The process involves carrying forward, with interest, the total establishment costs for year 0 (the preparation year), year 1 (the planting year), and years 2 and 3 (maintenance years). Total establishment costs (plus interest) for all 4 years ( $\$ 11,911.02$ ) are amortized over the productive life of the blueberry stand (17 years at 12 percent interest). Amortized establishment costs are identified under fixed costs in the full production budget summarized in Table 8.

## Budgets

The two categories of costs listed in the budgets are fixed and variable costs. Variable costs are those costs over which you have direct control. They can be increased or decreased at your discretion, or avoided if you chose not to produce. Variable costs increase as
the level of production increases. Examples of variable costs are blueberry plants, fertilizer, chemicals, fuel, repairs, hired labor, and interest on operating capital.

Fixed costs are those costs that remain unchanged no matter how much is produced or whether production takes place at all. These costs are associated with owning fixed inputs, and include depreciation, taxes, insurance, and interest.

Fixed and variable costs can be either cash or noncash costs. Cash costs are out-of-pocket expenses; they can be variable like fuel or fixed like property taxes. Cash costs must be paid outright. Noncash costs do not involve an immediate "cash" payment. For example, when you provide your own labor, cash is not exchanged, hence your labor is a noncash cost. If you choose to hire labor for the same operation, then the payment for labor becomes a cash cost. Accounting for noncash costs is particularly important in analyzing the actual cost of an enterprise. For this reason, both cash and noncash costs are treated as expenses in this budget.

Long-term, intermediate, and short-term capital are used in this budget to finance establishment costs, machinery, equipment, permanent structures, irrigation, and operating inputs. Interest on operating capital is treated as a cash expense. The cost of operating capital is 12 percent. Interest on investment is calculated at 12 percent and treated as a noncash expense. Overhead accounts for 5 percent of each year's variable costs, and includes costs such as insurance, office supplies, telephone bills, etc. (University of Idaho field crop and livestock budgets generally assume an overhead rate of 2 percent, but a management-intensive, high-valued crop like blueberries is expected to have a higher overhead cost. Thus, a 5 percent overhead rate is used.)

Table 2. Estimated equipment investment for a 2-acre northern Idaho blueberry farm. 1

| Item | Size | 1991 price (\$) | Annual use | Years to trade | Cost/hour (\$) | Cost/year (\$) |
| :--- | :--- | :--- | :--- | ---: | ---: | ---: |
| Tractor | 24 hp | 10,700 | 50 hr | 15 | 14.09 | 704.50 |
| Trailer | 8 ft | 1,000 | 30 hr | 15 | 0.32 | 9.60 |
| Boom sprayer | 50 gal | 650 | 10 hr | 15 | 13 | 11.30 |
| Fertilizer spreader | 10 ft | 3,500 | 5 hr | 15 | 31.46 | 157.30 |
| Cone fertilizer attachment | - | 525 | 5 hr | 15 | - | 11.18 |
| Mower | 5 ft | 1,000 | 10 hr | 15 | 111.80 |  |
| Rotary tiller | 5 ft | 2,500 | 15 hr | 15 | 14.25 | 213.75 |
| Roller/packer | 5 ft | 1,500 | 5 hr | 15 | 1.38 | 6.90 |
| Misc. equipment | - | 625 | - | - | - | - |
| (handspreader, backpack sprayer, shears, weedeater, scale, buckets, 15 picking stands) |  |  |  |  |  |  |

${ }^{1}$ All equipment is purchased new and used entirely in the blueberry operation.

Table 3. Permanently installed resources for a 2-acre northern Idaho blueberry farm.

| Item | Size/type | $\mathbf{1 9 9 1}$ purchase price | Useful life |
| :--- | :---: | :---: | :---: |
| Refrigeration | $10^{\prime} \times 16^{\prime}$ | $\$ 10,000$ | 20 years |
| Deer fence | New Zealand | $\$ 640$ | 20 years |

The authors - Larry D. Makus, associate professor of agricultural economics, and Craig L. Codr, undergraduate student, University of Idaho Department of Agricultural Economics and Rural Sociology; Danny L. Barney, Extension horticulturalist and superintendent of the Sandpoint Research and Extension Center, University of Idaho Department of Plant, Soil, and Entomological Sciences; Annette E. Levi, former research associate, and Bruce B. Davis, former research associate, University of Idaho Department of Agricultural Economics and Rural Sociology.

Table 4. Drip irrigation system for 2 acres of blueberries. ${ }^{1}$

| Item | Size | Quantity | Cost (\$) |
| :--- | ---: | ---: | ---: |
| Mainline PVC | $11 / 2$-inch | 140 feet | 78 |
| Tubing (\$0.12/ft) |  | 8,800 feet | 1,056 |
| Valves ( $\$ 24$ each) | 2 | 48 |  |
| Fittings and tees |  |  | 48 |
| Timer |  | 72 |  |
| Major shut-off | 2 -inch | 160 |  |
| Filters |  | 4,400 | 600 |
| Fmitters (\$0.16 each) |  | 704 |  |
| Fertilizer injector 6 gal/min ${ }^{2}$ |  | 160 |  |
| Power pump and power unit | 3 hp | $\underline{2,000}$ |  |
| Total cost |  | 4,926 |  |

${ }^{1}$ The irrigation system is assumed to have a 20 -year useful life.
${ }^{2}$ No injected chemicals are explicitly recommended in this budget. However,- the irrigation system is equipped with a fertilizer injector to provide additional flexibility in responding to changes in cultural practices.
Note: Installation labor requirements for 2 acres are 64 hours of hired labor; it is assumed this drip irrigation system is supplied by surface water.

Table 5. Costs per acre in preparation year (year 0) for blueberries in northern Idaho.

| Activity | Machinery (\$) | Labor (\$) | Materials (\$) | Total (\$) | Your cost |
